

Pavement Management Report 2021

Prepared for:
City of Santa Paula, Public Works Department

Prepared by:
m6 Consulting Inc.

February 21st, 2022

Table of Contents

❖ Introduction	2
❖ Pavement Management Program General Background	2
❖ Road Network Condition Inventory	3
❖ Recommendations	5
➤ Appendix A	6

Introduction

The City of Santa Paula maintains approximately 56 centerline miles of roadway.

m6 Consulting Inc. was contracted by the City of Santa Paula Public Works Department to update their Pavement Management Program (PMP).

All road segments provided by the City of Santa Paula have been previously visually inspected using Metropolitan Transportation Commission pavement inspection user guidelines and standards. The visual inspections were performed to obtain an updated pavement condition index (PCI) for each road segment. The current weighted average network PCI as of February 21, 2022 is 52. The network PCI based on the previous inspection from 2019 was 47, this is an increase of 5 points in the past 3 years.

Figure 1. City of Santa Paula Road Network

Pavement Management Program General Background

The Pavement Management Program (PMP) is based on field evaluations of pavement conditions utilizing the Metropolitan Transportation Commission (MTC) pavement management protocols and software. These provide a set of tools designed to assist decision-makers in finding cost-effective strategies for providing, evaluating, and maintaining pavement in serviceable condition. The program consists of two basic components:

1. A comprehensive web-based database, which contains current and historical information on pavement condition, pavement structure, and traffic data, if available;
2. A set of software tools that allow evaluation of alternatives, determination of existing and future pavement conditions, prediction of financial needs, and the identification and prioritization of pavement renovation projects.

Based on the field inspection data, PCI's are calculated by the MTC computer model. This establishes a baseline for evaluating the pavement condition of one roadway over another. The goal of the rating process is to produce index values that represent pavement conditions based on conditions

observed in the field using a random sampling method. The condition index values are a function of distress type, distress severity, and distress quantity present in the pavement surface area. The index values have been established to range from zero to 100. Higher index values indicate better pavement conditions. For example, a new pavement with no distress is assigned an index value of 100.

Road Network Condition Inventory

As shown in Figure 2, over 60% of the road network consists of residential/local roads. As reflected in Table 1 and Figure 3, approximately 54% of the road network is in fair to good condition and the remaining 46% is in poor to very poor condition. The overall network weighted average PCI for City of Santa Paula is 52 which is considered to be fair condition.

Table 1. Road Network Condition Summary

	Arterial	Collector	Residential/Local
Good (PCI 100-70)	4%	6%	25%
Fair (PCI 70-50)	6%	2%	11%
Poor (PCI 50-25)	8%	5%	22%
Very Poor (PCI 25-0)	1%	0.4%	10%
Weighted Avg. PCI	46	56	53
Total Weighted Avg. PCI			52

Figure 2. Percent of Area by Functional Class

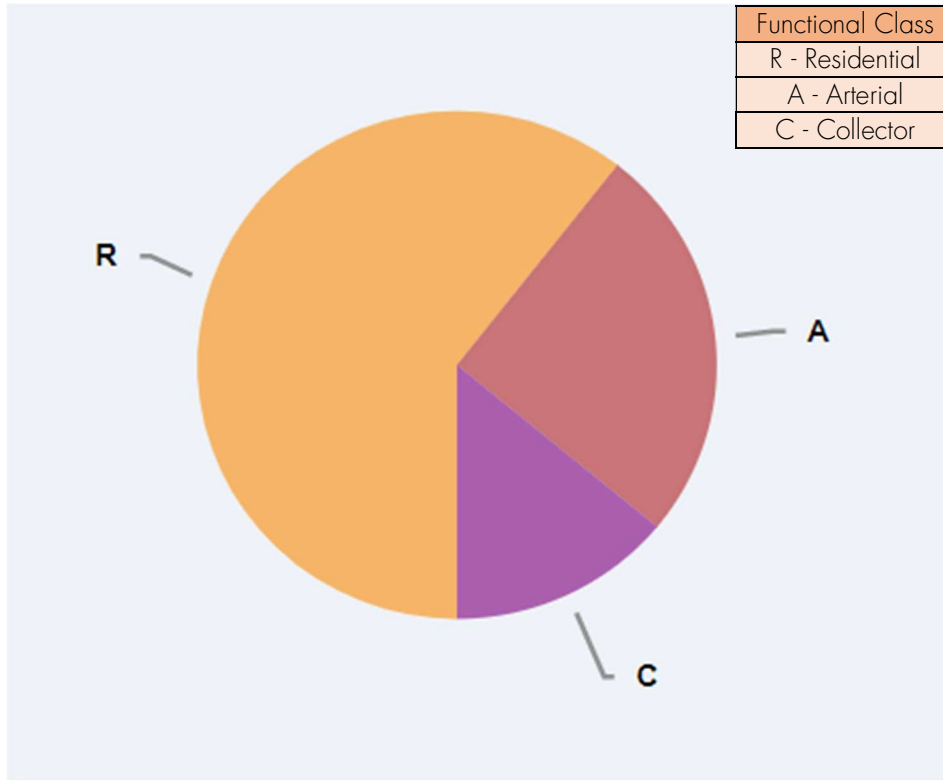

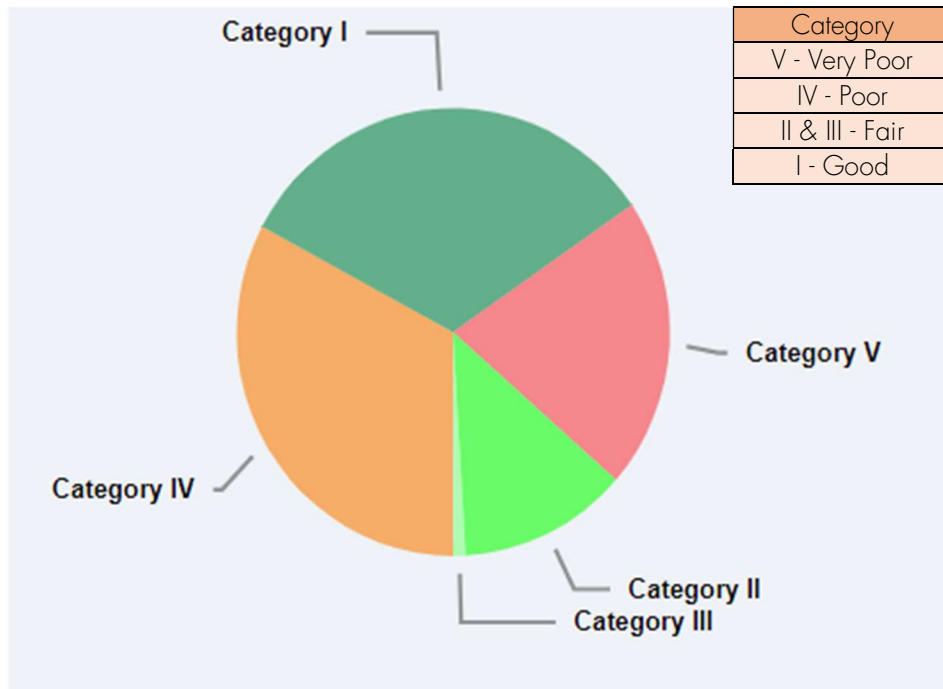

Figure 3. Percent of Area by Condition Category

Recommendations

The City should continue to maintain and update the StreetSaver database with any maintenance or rehabilitation (M&R) projects that occur with each year's paving cycle. This will continue to inform future budget projections, determining remaining life cycle of roads, adjustment to pavement curves, and updates to PCI values for roads that are resurfaced. Future pavement inspections for arterial and collector roads are recommended every 2 to 3 years since these roads typically receive higher volumes of traffic. Local residential roads are recommended to be re-inspected every 3 to 4 years.

Appendix:

- A. Listing of Roads with Current PCI

Appendix A
